

Milestone 3 Script

Jaskirat: Hello everyone, we are team Hygge (Hoogah) and we are here to give you an update on our project. A quick recap of Hygge, we it's a website for students by students, made specifically to relax. So, let's start off by a demo of the current version of the website. This is our main page, super simple and exactly like our prototype. All of our videos, meditations, music, links are all organized in the top bar and the login and sign up are the two icons in the top left corner. Our sign up and login pages are as simple and straightforward as our main page. We still have to add content to our categories in the top bar, but we have planned for that in our final milestone.

Onisokien: We were successful for our MVP, as we achieved everything we set out to do for the milestone. We feel this is a good MVP because it shows the structure and layout for the website and it is easy to envision where we will put our next changes for the next milestone. Also, our code is clean and easy to understand as we followed all the guidelines presented in the lecture that help create clean code. We have meaningful variable names and the structure of our code flows in a logical way. We plan on continuing to follow the same thing we have been doing for creating clean code, while heading into the next milestone.

Shrey: Our FRD has now been updated with copies of our diagrams, and pictures of our user interfaces, and a copy of our clean code review. For our Kanban board, we added more user stories based on what a user expects from our website. We are still in the process of coding our website and testing it, so that's why a majority of Kanban board consists of that. We are still following the same organization scheme for Github as it is easy to understand and update as well.

Jaskirat: So for update on our lofi prototypes, we decided on our login and sign up pages, which everyone already saw in the demo. As for our class diagram, we changed a few things based on the code we wrote. Before we were just using our best guess as we hadn't started coding yet. So, once we wrote our code, our class diagram changed as well. This is all we have for now, as that's all we had to code for MVP-1. For our last MVP, we plan on adding the content to each of our categories. So this means adding music links to our music section and videos to our video section and so on. Some barriers to our success are, that we don't have much time left in the semester and all of our class projects and assignments are due in the next couple weeks as well. So, we really have to try managing that along with our coding required for the last milestone.

Onisokien: For our Github, the file structure has remained the same from our last milestone. It was easy to use and update and we felt it was a good idea to use the same structure moving forward. So, we still have repositories for each of the milestones, which contain the presentation powerpoint, our script and the updated version of the functional requirements document.

Shrey: For our group reflection, what we really liked about this milestone was that it allowed us to keep up with the progress of our project by thinking about our MVP, and then also planning for the next one. There wasn't anything in particular we didn't like about this milestone, every requirement was pretty straight forward or already discussed in the previous milestone and just required updates on our part.

Jaskirat: What we learned from this milestone is that it is pretty difficult to collaborate on code for a project as such all at the same time. Going forward, we will follow our policy of having an individual that is a designated coding head and continuing our policy of meeting every three or four days to talk about changes and updates, along with code review. We feel this is the best policy moving forward and we will continue to use this into our next milestone.

Onisokien: For things we would like help with, is just input and feedback from Tim on our website. Any sort of comments would be greatly appreciated as we approach our next milestone. Other than that, it's just a matter of working on and completing our next milestone's requirements. Thank you.
