Milestone 2 Script

Jaskirat: Good morning everybody, we are team Hygge (Hoogah) and we are back at it again. So, a quick refresher on Hygge (Hoogah); it's a website for students by students, made specifically to relax. So let's begin with our Model View Controller. So our model contains our data for our videos, meditations, and music. And these are the exact things that will be seen in the view or interface of our website, which will also include our logo. For our controller, everything in our view is clickable. The bar at the top contains drop down menus whereas the sign in and login are icons that can be clicked.

Onisokien: DOMAIN DRIVEN DESIGN & ADD ABOUT CLASS DIAGRAM

Shrey: ADD ABOUT SEQUENCE DIAGRAM

Jaskirat: We wanted to keep our website very clean and easy on the eyes. We will be keeping a simple black and white theme with mellow pops of pastel colours, which will also be seen in our website logo which we will show near the end of the presentation. Our whole purpose is to make this website a space to chill, and we felt our colour scheme and logo should embody this idea as well. That's why our lofi prototype looks so plain, we wanted to keep our website as clean and organized as possible.

Onisokien: One thing we really liked about this milestone was the lofi prototype. It really helped map out the layout of the website and get us into the mindset of beginning to code it. One thing we did not enjoy this milestone was the functional requirements document. The template given had some vague section descriptions and not everything given on the template was important for individual projects. Perhaps, it would be better if we could build the functional requirements document from scratch as a way to document our process for the project.

Shrey: What we learned from this milestone is that everyone needs to pull their weight for a successful milestone. However, we also learned going forward that we may need to step up for a teammate every now and then and be understanding of each others situations.
